

Amara Nest companion studs

Independent design for the Amara necklace. Contribution: design exploration, Blender CAD, renders, dimensioned assembly and component documentation. Status: CAD developed; jewellery sample pending.

Assembly drawing from the existing Rev49 technical package. Dimensions describe the CAD before finishing.

Key design and construction decisions

Collection fit: retained the heart and gold-wrap identity in a compact sculptural stud, with a separate silhouette from the necklace. The public bestseller edit informed the choice; no internal sales data was used.

Documented geometry: head envelope 9.04 × 9.34 × 5.58 mm; heart CZ model 6.00 × 6.00 × 3.55 mm; clear post length 10.50 mm. Drawings include post references, shell section and isolated seat views.

Proposed specification: 925 sterling silver, 18K vermeil with a 3.5 µm target, satin fold and polished rim/prong tips. These are design targets requiring supplier confirmation.

Sample review: check actual stone profile and bearing fit; agree finished wall and prong sections; confirm post/backing system, attachment strength, finish and ear comfort. A rendered model does not establish these results.

Confluence and physical work

Confluence is jewellery work completed before Amara. Its current development pack documents a three-stone ring and the proposed path from CAD to supplier review.

Dimensioned assembly sheet from the current CF-R01 / SPEC C package. Pre-setting CAD geometry; physical sample pending.

- CAD documentation:** body 21.42 × 23.08 × 6.00 mm; 18.00 mm nominal bore; 12 stock prongs. Eight sheets cover assembly, sections and setting, materials/BOM, proposed tolerances, sample QC, costing/MOQ inquiry and release requirements.
- Production judgment:** confirm purchased stones before final bearings; agree finished sections and process compensation; inspect stone retention, bore, surface finish and coating against an approved sample. Quote and sample results remain open.

Physical 3D printing experience

I designed and physically 3D printed the trophies, medals and sculptural objects in my Printed Objects portfolio. Production is ongoing. My experience also includes hands-on 3D printing as a CAD and Fabrication Intern at Innovia Labs in 2023.

The Zenith Cup

World

Medal

CAD renders of designs I have physically 3D printed. Production is ongoing; workshop photography is not yet included.
